

b) a latch body extending under the plate and through the opening in the panel when the latch is mounted in the panel, the latch body forming a central well, the well extending through the plate, the latch body including a first and a second opposed side wall, the first and second side wall having a respective first and second aperture formed therein, and

c) an actuator extending from the latch body for releasably engaging the frame; the actuator being accessible through the central well, the actuator including an integrally formed spring means for biasing the actuator, the actuator traveling from a closed to an open position when the latch is operated against the bias of the spring means, the actuator having a first and second pin extending outwardly therefrom for travel within the respective first and second aperture when the latch is operated, and

the apertures and pins comprising camming means controlling the travel of the actuator when the latch is operated. - -

REMARKS

Claims 1 - 13 are pending in the present application.

The claims have been amended to more particularly point out and distinctly claim applicant's invention to put the claims in better form for appeal. New claim 13 includes the subject matter of claim 4, which the Examiner indicated to be allowable, and also incorporates the subject matter of claim 3 from which claim 4 directly depends and independent claim 1 from which claim 4 ultimately depends. New independent claim 13 is fully supported by the application as filed and incorporates no new matter.

Applicant gratefully notes that the Examiner has withdrawn the rejection of claim 4, and indicated that this claim would be allowable if rewritten in independent form to include the limitations of the base claim and any intervening claims. Applicant has rewritten claim 4 as new
